HYBRIS: CORE #10

Task:

Change default HAC and HMC URLs to be "/admin" and "/manage" respectively. Ensure you do not modify the extensions that belong to Hybris platform.

Step 1 – Change webroot URLs

The configuration of an extension is described by the extensioninfo.xml file. HAC and HMC have <webmodule> tags in their info files.

<webmodule additionalclasspath="" jspcompile="true" webroot="/hmc"/>

<webmodule jspcompile="false" webroot=""/>

If we don't want to touch the extensions then our option is the local.properties file under the folder of hybris/config.

The key-value pairs we need are:

```
hac.webroot=/admin
hmc.webroot=/manage
```
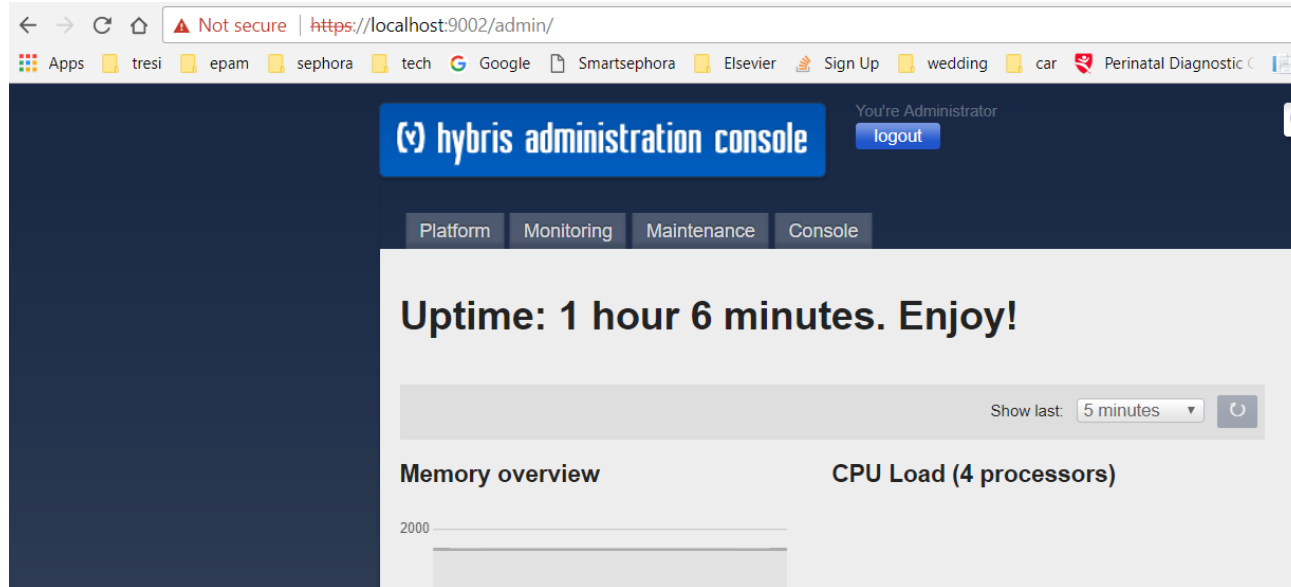

Step 2 – Run the Ant build target

Physically the webroot URL definitions have to go to the tomcat's server.xml file.

Therefore we have to run the proper ant build that moves our changes from the local.properties into the server.xml.

I used the all target for this.

Step 3 – Verification

We can check in a browser if the new URLs are working.
